

A managed lifecycle for machine learning models

A collaboration with GitLab's data science team, establishing a method that applies to any model.

Organizations running machine learning in production encounter a common failure: the models perform, yet no record connects a result to the model that produced it. GitLab presented a Boston University capstone team with a production model and asked for a remedy.

What the method delivers

- Every published figure traces to the model that produced it
- An earlier version can be restored in a single step
- Performance is recorded alongside the model it describes
- Scheduled monitoring keeps performance visible over time

THE STANDARD

The measure is not whether the method functions today, but whether a year from now someone with no involvement can still establish which model produced which figure.
